You can use the docking station to easily clone the contents of connected disks without the need to connect to a PC. Insert the source disk into the first slot of the station HDD A (source) and insert the target disk into the second slot HDD B (target). Then you just press the clone button and watch the cloning process on a scale of four LEDs. After all the data has been copied, there is an exact copy of the original disk on the destination disk. The dock can thus be used as an autonomous device for convenient duplication and disk image creation. This is the easiest way to transfer the contents of old HDD to new SSD, including a working operating system (Windows, macOS, Linux).

SATA 6G interface with UASP support allows you to enjoy the speed of modern SSD disks. The TRIM feature support limits the gradual degradation of SSD performance over time. Reading of S.M.A.R.T. information monitoring the SSD/HDD condition. Supports sleeping of the connected disks and station.

The station case is sufficiently robust and durable, which allows perfect stability even with inserted disks. Rubber anti-slip pads prevent sliding on the table and vibrations of the hard drives. The outer casing is made of aluminum with an elegant brushed surface.
